

The ScanToBid Handbook

Every screen, every button, and what each one is actually for. Written for somebody who has never opened it. The contents list overleaf is the fastest way in.

Before you start

Five minutes, once. Everything after this is the job.

Getting it on the phone

TERMINAL, ON THE MAC

ScanToBid is not on the App Store yet, so it goes on your phone from your own Mac.

- 1 Plug the iPhone in with a cable, unlock it, and tap Trust if it asks.
- 2 Open Terminal and type `cd ~/trueline && git pull && bash build.sh`
- 3 It pulls, checks everything, compiles, installs and launches. No Xcode window.
- 4 First time only: on the phone, Settings → General → VPN & Device Management → your Apple ID → Trust. Then run it again.

YOU WILL KNOW IT WORKED WHEN

ScanToBid opens on the phone and shows an empty list of rooms.

What it costs, and what it never will

FREE / PAID

Measuring is free forever. What turns a drawing into money is the subscription.

- 1 Right now nothing is withheld from anybody. ScanToBid is not on the App Store yet, so there is nothing to buy, and the paid screen says so in those words: **Everything is on, free, right now.**
- 2 When it does go on sale — free, with no account and no card: scanning, walking a room, the drawing, the 3D view, correcting anything on it, and the room's dimensions.
- 3 Free keeps one room at a time. One room with the whole app on it, not a cut-down room.
- 4 The subscription adds the quantities, pricing, proposals, signatures, change orders, scheduling, invoices, insurance mode, your supplier's and your stores' prices, and every export.

YOU WILL KNOW IT WORKED WHEN

You can measure your own kitchen tonight without paying anything.

The one-room limit only ever stops a *new* room being written down. Nothing already on the phone is taken away — every room still opens, still corrects and still exports — and the banner that appears says so under its own heading, **This new room was not kept.**

Your business details FREE

TOP OF THE SCREEN → YOUR BUSINESS

What goes at the top of everything a client sees. Fill it in once.

- 1 Tap **Your business** at the top.
- 2 Name, phone, email, licence number and insurance. Add a logo if you have one.
- 3 Fill in **Business address**. It goes on your letterhead, and it is where a client has to post a cancellation on the three-day notice — federal law makes filling that in your job, so a proposal signed at a client's home cannot carry its cancellation forms without it.
- 4 Under **What do you do?** pick your trade — painting, flooring, drywall, tile, trim, restoration, framing, or general remodeling.
- 5 Pick feet and inches, or metric.
- 6 Tap **Save**.

YOU WILL KNOW IT WORKED WHEN

Your name and licence appear on every drawing and document from now on.

The trade you pick changes the words and the order on the takeoff — never a number. A rate you set stays set if you change your mind later.

Scan a room FREE

FIRST SCREEN → SCAN A ROOM

For an iPhone with LiDAR. The phone finds the walls itself while you walk.

- 1 Stand in a corner with the room in front of you.
- 2 Walk the perimeter slowly, keeping the phone up and pointed at the walls.
- 3 Cover every wall, including behind furniture where you can.
- 4 Tap **Done** when the room is closed.

YOU WILL KNOW IT WORKED WHEN

The room appears in the list, and opens on the drawing.

A scan arrives already squared up. Every corner meets perfectly whether the room is right or wrong — which is why nothing is called measured until a tape has been on it.

Getting a room in

Three ways in, depending on the phone and what is in front of you.

Measure a room by hand FREE

FIRST SCREEN → MEASURE A ROOM

Works on any iPhone, with or without LiDAR. You place every corner yourself.

- 1 Watch the sentence at the top. It will say *Starting up*, then ask you to move the phone slowly from side to side.
- 2 When it settles it says **Lay the phone flat on the floor and tap Set floor.** Do exactly that — face up, flat, then tap.
- 3 Pick the phone up. It now says **Touch the foot of a corner — anywhere on the picture**, and the crosshair goes solid.
- 4 Touch the picture where each corner meets the floor — anywhere on the screen, not just the middle. Walk to the next one and touch it.
- 5 Wall lengths appear along the bottom as you go.
- 6 Back at the first corner it says so. Touch it again, name the room, and tap **Done**.

YOU WILL KNOW IT WORKED WHEN

Dots on every corner, lines along every wall, and the lengths written on them.

If it stalls, the sentence on screen is the diagnosis — it is different for every reason it can fail. Read it rather than guessing.

Move a corner you already placed

FREE

WHILE MEASURING

For the corner that landed a foot off because a chair was in the way.

- 1 Press on the dot you want to move and drag it.
- 2 The sentence at the top changes to **Moving that corner — let go to drop it.**
- 3 Let go when it is where you want it.

YOU WILL KNOW IT WORKED WHEN

The dot and the wall lines follow your finger.

Measure between any two things

FREE

WHILE MEASURING → DISTANCE

Not a room — one measurement. A countertop, a window, a gap.

- 1 Tap **Distance** at the top of the measuring screen.
- 2 Touch one end of what you are measuring.
- 3 Touch the other end.
- 4 The length appears big enough to read at arm's length.

YOU WILL KNOW IT WORKED WHEN

A number you can write down. Touch anywhere to start another.

Keep the Rooms list under control

FREE

ROOMS

Twenty scans in one list is not a list. Name them, group them by house, find one, and put finished work away.

- 1 At the top of the **Not in a job yet** list, tap **Put them in a job** and type the property — "118 Willow St". Or swipe one room to the right and tap **Job**.
- 2 A room is named on the room's own screen, next to the plan: tap **Rename**, type it, tap **Set**. That is the name on every drawing and every document it makes, and it is the name the Rooms list and the bar at the top show.
- 3 The second room of the same house: tap the address listed under the box instead of typing it again.
- 4 Rooms group under their job, newest house first. Anything with no job sits at the bottom, waiting for one.
- 5 Pull the list down for the search box — it matches the room, the job, and how it was captured (scanned, walked, drawn).
- 6 Swipe a finished room to the right and tap **Archive**. It leaves the list and nothing else: still on the phone, still in iCloud, still there under **Archived** at the top left.

YOU WILL KNOW IT WORKED WHEN

A first screen that shows the work in front of you, not everything you have ever

scanned.

The name is a label. The folder on the phone keeps its own timestamped name and does not move — that name is its address in iCloud and under every photograph in it, and moving a folder is how a backup ends up pointing at nothing.

Take the tour, or open the worked example FREE

ROOMS → TAKE THE TOUR

A finished kitchen with every screen filled in, and a guided walk through all of it — before you have scanned anything.

- 1 Tap **Take the tour** at the top of the Rooms tab. It opens a kitchen that was scanned, taped on two walls, priced off a rate book, written up, signed, invoiced, and marked up as a water claim.
- 2 The card at the bottom moves you through every part of a job in the order you would do it — the drawing, the room, the takeoff, the price, the proposal, the signature, the change orders, the calendar, the invoice, the claim and the files. **Next, Back, or Stop the tour** at any point.
- 3 Each stop rings the thing it is talking about, so you are looking at the control rather than hunting for it.
- 4 **Open the worked example** underneath is the same kitchen with no card over it, for when you want to read a screen properly or show somebody a takeoff.

YOU WILL KNOW IT WORKED WHEN

You have seen every screen in the app with real numbers on it, without needing a room, a phone with LiDAR, or ten minutes.

It is not your work. The example carries its own business details and its own rate book, lent to the screen while it is open and given back the moment you leave — nothing in it can touch your profile, your rates or your rooms, and nothing you change in it is kept.

Draw a room by tapping its corners

FREE

ROOMS → DRAW A ROOM

Any shape, no compass, no LiDAR, no camera. Tap the corners the way you would walk round the room.

- 1 Tap **Draw a room** at the top of the Rooms tab, give it a name, then **Start drawing**.
- 2 Tap each corner in turn. They join up as you go and each wall shows its length.
- 3 A wall that is nearly level is taken as level — a thumb is not square and most rooms are. Draw a real angle and it keeps the angle.
- 4 Tap the **amber corner** — the one you started at — to close the room. **Closer** and **Further out** zoom; one square is 6 inches.
- 5 **Open it**, then tap any wall to name it or put a tape reading on it.

YOU WILL KNOW IT WORKED WHEN

A drawing of the right shape, straight away — and it lands in Rooms with everything else.

Every length came off the grid, not a tape, so the sheet says **DRAWN** and the app goes on asking for a tape on one wall running each way — exactly as it does after a scan. Tapping is a shape, not a measurement.

Type a room in wall by wall

FREE

ROOMS → DRAW A ROOM → OR TYPE IT IN WALL BY WALL

For a room you already have the numbers for, off an old sheet or a tape log.

- 1 Tap **Draw a room**, then open **Or type it in wall by wall** underneath.
- 2 Type each wall's length and pick which way it turns.
- 3 The closing wall is worked out for you.
- 4 Name it and finish.

YOU WILL KNOW IT WORKED WHEN

A room that reads as
MEASURED

, not scanned — because you typed the numbers yourself.

This is the only mode where every number is measured from the first keystroke. It also cannot draw a shape that is not a run of compass headings — for a bay window or a cut corner, tap the corners instead.

Undo a corner FREE

WHILE MEASURING

The button says how many points are down, so you can see it work.

- 1 Tap **Undo 4** — the number is how many corners you have placed.
- 2 It becomes **Undo 3**, and the last dot and line disappear.

YOU WILL KNOW IT WORKED WHEN

One fewer dot on the screen and one fewer number along the bottom.

The drawing

What a client sees. Everything on it says where its numbers came from.

Reading the colours FREE

PLAN

Every wall is coloured by how its number got there. This is the whole point of the app.

- 1 **Black** — measured. A tape has been on it.
- 2 **Amber** — scanned. The sensor's own number, never checked.
- 3 **Violet** — moved by hand. You dragged it. It does *not* count as measured.
- 4 **Grey** — no wall here. An open span.
- 5 **Red** — something was in the way when it was scanned.
- 6 The wall you have just tapped is drawn in the sheet's own ink — near white on a dark screen, near black on a light one — with the rest of the drawing dropped back so your eye lands on it. That is the one mark here that is not a provenance: it means *picked*. The wall's own colour is still drawn on top of it, so a wall you dragged goes on saying it was dragged while you are dragging it.

YOU WILL KNOW IT WORKED WHEN

You can tell at a glance which numbers on the sheet you would defend.

Blueprint and 3D FREE

PLAN → BLUEPRINT / 3D

The same room, two ways. Tapping a wall works in both.

- 1 Tap **3D** to stand it up.
- 2 Drag to walk around it.
- 3 Walls between you and the room are taken off so you can see in — it says how many.
- 4 Tap **Straighten up** to get back to square.

YOU WILL KNOW IT WORKED WHEN

A picture of the room you can turn, with every wall still tappable.

Stand inside the room FREE

PLAN → 3D → STAND INSIDE

The room from in it, in perspective, instead of from outside it. What a plan cannot show: what it looks like from the door.

- 1 Tap **3D**, then **Stand inside**.
- 2 Drag to look around — left, right, up at the ceiling.
- 3 Tap a wall from in here and it selects the same wall the tape box re-solves — the wall's name is printed on it, so you know which one you are about to tap. It is the same drawing, not a picture of it.
- 4 Tap **Straighten up** to face the longest wall again, or **Back outside** to orbit it.

YOU WILL KNOW IT WORKED WHEN

You are in the middle of the room looking at the longest wall, with the ceiling above you.

Walls behind you are not drawn, and the line underneath says how many. That is not a missing wall — it is a wall behind your head.

Cut the room at a height FREE

PLAN → 3D → CUT IT

Slice the room at four foot and take everything above it off. The oldest drawing convention there is, and the one that makes base cabinets and pony walls legible.

- 1 Tap **3D**, then **Cut it**. It opens at 4 feet — above the counters, below the door heads, which is where a drawing is cut by convention.
- 2 Tap any of the heights beside it to move the plane.
- 3 Every height offered is somewhere in this room: the top of a wall that stops short, a window sill, a door head. Nothing on the list shows you the same picture twice.
- 4 Tap **Whole room** to put it back.

YOU WILL KNOW IT WORKED WHEN

The walls come down to the plane, and a window the plane goes through is drawn up to it and no further.

A cut moves no number — it is a way of looking at the room, not a change to it. If a window has no recorded sill the plane cannot say whether it crosses it, and the line underneath says so rather than guessing.

Furniture on and off FREE

PLAN → HIDE WHAT WAS IN THE ROOM

What the scan found standing in the room, drawn faintly.

- 1 Tap **Hide what was in the room** before sending a drawing to a client.
- 2 Tap it again to bring it back.

YOU WILL KNOW IT WORKED WHEN

The building on its own — what goes to a client or an adjuster.

Taking furniture off moves no number. A scan reports the walls and the objects separately, and no measurement here has ever read a piece of furniture.

The ceiling, as a surface you work on FREE

PLAN → TAP THE MIDDLE OF THE ROOM

A water stain, popcorn coming off, a soffit, a dropped beam. Until now the ceiling was the one surface in the room with no panel of its own.

- 1 On the blueprint, tap the empty middle of the room. The line under the drawing says so: tap a wall to measure it, tap the middle of the room for the ceiling.
- 2 **The ceiling** opens with its area. It follows the floor — it is the same figure the sheet charges against the ceiling, not a second sum.
- 3 Say what is being done to it, exactly as you would on a wall.
- 4 Anything you measured by pointing the phone up — a soffit, a beam, the width of a stain — is listed here rather than disappearing when the measuring screen closes.
- 5 Tap the middle of the room again to close it, or tap **Done**.

YOU WILL KNOW IT WORKED WHEN

A panel for the ceiling with its area, what is being done to it, and anything you measured up there.

The 3D view still leaves the ceiling off, which is what makes it possible to see into the room at all. **Look up** there puts the ceiling back on its own with the walls dropped away, and **Put the walls back** ends it. A length pointed at with the phone always carries its band on it and is never a tape reading — it

can never become the ceiling height, which multiplies every square foot of board in the room.

Rename the room FREE

PLAN → RENAME

It arrives called *garage.json*. Give it the name you would say out loud.

- 1 Tap **Rename** at the top of the drawing.
- 2 Type it — “Gilbert’s kitchen”.
- 3 Tap **Set**.

YOU WILL KNOW IT WORKED WHEN

That name heads the drawing, the takeoff, the proposal and the claim.

Correcting the room

A scan is a starting point. This is how it becomes true.

Put a tape on a wall FREE

PLAN → TAP A WALL → IT HAS HAD A TAPE ON IT

The most important thing in the app. Everything else waits on this.

- 1 Measure the wall properly, with a tape.
- 2 Tap the wall on the drawing.
- 3 Type the reading into **It has had a tape on it**.
- 4 Tap **Set**.

YOU WILL KNOW IT WORKED WHEN

The wall goes black, says measured, and the whole room re-solves around it.

One wall running each way is what the room needs before it will call itself measured. Two tapes, not eight.

Move a wall the scan got wrong FREE

TAP A WALL → MOVE IT — WITHOUT A TAPE

For a wall in the wrong place when you have no tape on you.

- 1 Tap the wall.
- 2 Type where it should be under **Move it — without a tape**.
- 3 Tap **Move it**.

YOU WILL KNOW IT WORKED WHEN

The wall goes exactly there and the room gives way around it — in violet, marked **MOVED BY HAND**

Moving every wall in the room still leaves it unmeasured, and the app will still ask for a tape. That is deliberate and it will never change.

Name a wall FREE

TAP A WALL → CALL IT SOMETHING

“Behind the washer” beats “wall-1” on every sheet this makes.

- 1 Tap the wall.
- 2 Type a name under **Call it something**.
- 3 Tap the button beside it.

YOU WILL KNOW IT WORKED WHEN

That name appears on every sheet, and anything marked on the wall moves with it.

Cut a wall in two FREE

TAP A WALL → CUT IT IN TWO

For a pony wall meeting a full-height one, recorded as a single wall.

- 1 Tap the wall.
- 2 Under **Cut it in two**, say where to cut it, what to call the second piece, and how high it stands.
- 3 Tap the button.

YOU WILL KNOW IT WORKED WHEN

Two walls where there was one, each with its own height.

It refuses if your answer makes the two pieces identical. Two walls in line that are alike in every way are one wall written twice.

Notch a corner for an alcove FREE

TAP A WALL → NOTCH THE CORNER AFTER IT

For the alcove or chimney breast the scanner flattened.

- 1 Tap the wall before the alcove.
- 2 Under **Notch the corner after it**, give how deep the step goes, how wide it is, and what to call it.
- 3 Tap the button.

YOU WILL KNOW IT WORKED WHEN
TWO

walls appear, not one — a room with square corners always has an even number of sides. The room does not change size.

Take a wall out FREE

TAP A WALL → THERE IS NO WALL HERE AT ALL

For a side the scan invented.

- 1 Tap the wall.
- 2 Tap **There is no wall here at all**.

YOU WILL KNOW IT WORKED WHEN

The side goes, and the line under the plan names which walls moved and by how far. Undo is one tap.

Doors and windows FREE

TAP A WALL → THE OPENINGS ON IT

Their sizes come off the scan.
Measure them and every quantity follows.

- 1 Tap the wall the opening is in.
- 2 Tap **Measure** beside the door or window.
- 3 Type its width, its height, and how far it is from the corner.
- 4 For a window, type the sill height off the floor.

YOU WILL KNOW IT WORKED WHEN

The baseboard, the wall face and the paint area all move to match — doors taken off, windows left on.

Ceiling height FREE

ROOM → HOW HIGH IS THE CEILING?

The number the wall face is worked out from. Worth a tape.

- 1 Go to **Room**.
- 2 Tap a common height, or type the one you measured.

YOU WILL KNOW IT WORKED WHEN

Every wall area on the takeoff moves, and the floor area does not.

Wall thickness FREE

ROOM → WALL THICKNESS

A scan reports every wall as zero thick. Saying what it is unlocks the framing.

- 1 Go to **Room**.
- 2 Pick 2x4, 2x6, or type it.

YOU WILL KNOW IT WORKED WHEN

Plates, studs and headers appear on the takeoff, and the drawing draws the wall at its real thickness.

Split an open plan FREE

ROOM → SPLIT AN OPEN PLAN

One space that has to be priced as two — a kitchen running into a dining area. Each side gets its own floor, ceiling, baseboard and wall face.

- 1 Go to **Room** and find **Split an open plan**.
- 2 Say where the divide starts: which wall, and how far along it.
- 3 Say where it ends, on a different wall.
- 4 Name the two sides — Kitchen and Dining.
- 5 Tap **Draw a line on the floor**. The takeoff now shows both, and the whole room underneath.

YOU WILL KNOW IT WORKED WHEN

A dashed violet line across the drawing with both names on it, and two sets of quantities on the takeoff.

This is the thing the whole field gets wrong. The advice people are given is to lay painter's tape on the customer's floor so the scanner sees a corner. The other way — putting a wall through the space — is worse: the estimate then carries drywall, paint and baseboard for a surface nobody will ever build. A line on the floor bounds area and nothing else. If there really is a half wall, add it as a wall so it carries what it should.

What is behind the wall FREE

ROOM → WHAT IS BEHIND THE WALL

Where the joists run, where the stack comes down, what you found when the wall was open. Pinned at the spot, kept for as long as the drawing exists.

- 1 Go to **Room** and scroll to **What is behind the wall**.
- 2 **Tick everything you found in the one opening** — framing, plumbing, electrical, heating and air, gas, structure, hazard, access, other. As many as apply: an open wall is rarely one thing, and the ones you leave off cannot be gone back for once it is closed.
- 3 Pick the wall, say how far along it, and how high if that matters.
- 4 Type what you found — “2x10 joists east to west, 16 in centres”. **Pin it**.

YOU WILL KNOW IT WORKED WHEN

A blue square on the drawing at the spot, and one line in the list reading “Framing + Plumbing + Electrical on wall-1 — ...” that you could read down the phone to somebody.

It never becomes a quantity and it is never on the takeoff. A joist is a fact about the building, not a loss and not a line item — which is also why it is not filed with insurance damage.

Say it instead of typing it FREE

PLAN → TAP A WALL → RECORD A NOTE

You have a tape in one hand and a phone in the other. Talk at the wall and the phone keeps both the recording and the words.

- 1 Tap the wall you want to say something about.
- 2 Tap **Record a note** and say it.
- 3 Tap **Stop**. The recording is kept straight away.
- 4 A moment later the words appear underneath it. Read them and fix anything that is wrong.

YOU WILL KNOW IT WORKED WHEN

A player you can tap, and a line of text under it that goes on the sheet you carry.

The words are written by the phone until you touch them, and it says so. Jamb, soffit, kerf and R-13 are exactly what it gets wrong — the recording is what actually happened, and it never changes when you correct the text. Recording is only offered inside the app, on a room that is open; an older iPhone that cannot write speech down still keeps the recording and says there is no transcript.

Take the walk's photographs off a wall FREE

PLAN → TAP A WALL → THE PHOTOGRAPHS UNDER IT

A scan photographs the room every two seconds, so a walk leaves fifty-odd frames. Deleting them one at a time on a phone is unusable. These go in a batch, and what each one is doing is said before it goes.

- 1 Tap the wall. Its photographs are underneath — best first, the one that shows most of the wall.
- 2 Tap **Pick several**. Every frame of that wall appears, not just the best twelve, and each one shows its own file name — telling one hallway frame from another is exactly what went wrong the day a room lost 53 photographs.
- 3 Tick the ones to go, or **Select all**. **Clear** unticks them; **Done picking** leaves the wall alone.
- 4 Tap the delete button. It says how many are going, in words, off the set that is actually going — never a number you have to work out from which thumbnails look ringed.
- 5 Read what comes up. It says how many of them are the only photograph of a wall, and it names the walls that nothing would show afterwards.
- 6 **Delete them** does it. **Keep them** does not.

YOU WILL KNOW IT WORKED WHEN

The frames are off the job, and

PUT THEM BACK

is offered until you leave the screen.

This takes the photographs off the room — off the plan and off anything printed from it. The picture files stay in the scan's folder where the app put them: nothing here wipes anything off the phone and nothing here claims to. Once you leave the screen the room is saved without them and the saved room is what opens next time, so **Leave them off** is the end of it.

Mark what is wrong with a wall FREE

PLAN → TAP A WALL → + PART OF THIS WALL

Rot, a crack, a wall out of plumb, something you cannot get at. On an ordinary job it is a note; on a claim it is damage.

- 1 Tap the wall it is on.
- 2 Tap **+** **part of this wall** and pick what it is.
- 3 Say how far from the corner it starts, how wide it is and how high it goes.
- 4 Tap **Mark it**, then photograph it or record a note about it.

YOU WILL KNOW IT WORKED WHEN

A stretch drawn on the plan, and a line on the sheet you carry saying what it is, where it is and what you said about it.

It never touches the takeoff and it carries no square feet: noticing something is not the same as being paid to fix it. Turn insurance on for this job and the same mark starts pricing as tear-out, with the cut height and the moisture readings an adjuster asks for.

Say what is being done to each surface FREE

PLAN → TAP A WALL → WHAT IS BEING DONE HERE

Every room is priced as if all of it were being replaced — the whole floor, the whole ceiling, every wall face, all the baseboard. That is right for a gut job and wrong for most jobs.

- 1 Tap a wall, or open **Room** for the floor and the ceiling.
- 2 Tap **Say what is being done** to start with everything ticked and untick what is not, or **Start from nothing** and tick only what is.
- 3 The takeoff and the price follow the ticks straight away.

YOU WILL KNOW IT WORKED WHEN

A sheet with the floor you are not touching off it, instead of a total that quietly includes it.

A room nobody has scoped is still priced as a full replacement — that is the old behaviour, kept on purpose, so nothing changes under a job already quoted.

Say how much of a wall is being done FREE

PLAN → TAP A WALL → WHAT IS BEING DONE HERE

Thirty square feet of a wall that measures eighty-four. One door of the two. Part of a surface, rather than all of it or none.

- 1 Tick what is being done to the wall.
- 2 Under the tick, type how much of it into **How much of it?**
- 3 Leave the box empty for the whole of it, or tap **Do the whole** to put it back.

YOU WILL KNOW IT WORKED WHEN

The sheet counts what you typed, and says beside it what the room measures and that the figure is yours.

It is never treated as a measurement: a line carrying a figure you typed is never called measured, and the room's own number stays beside it everywhere. More of something than the wall has is refused rather than quietly cut down to fit.

What still needs checking FREE

ROOM

The app's own list of what it does not yet trust about this room.

- 1 Go to **Room** and read down.
- 2 It ranks the walls worth a tape first, by what is at stake.
- 3 The number on the Room tab is how many things are on this list.

YOU WILL KNOW IT WORKED WHEN

A list that gets shorter as you correct things, and empties when the room is ready to issue.

Reading the takeoff SUBSCRIPTION

TAKEOFF

Floor, ceiling, wall face, baseboard, and the framing once thickness is set.

- 1 Go to **Takeoff**.
- 2 Tap **Show** to see what each line is for and how it was worked out.
- 3 Every door and window is already taken off the wall face.
- 4 A door is taken off the baseboard; a window is not.

YOU WILL KNOW IT WORKED WHEN

Numbers you could hand to a supplier, each one traceable to a measurement.

What the room takes

Every quantity, worked out from the measurements. This is where the subscription starts.

Your trade's words SUBSCRIPTION

TAKEOFF

A painter sees paint areas. A drywaller sees board areas. Same numbers.

- 1 Set your trade under **Your business**.
- 2 The takeoff reorders to lead with the lines you care about.
- 3 Everything else is still there, below them.

YOU WILL KNOW IT WORKED WHEN

The sheet reads in your words rather than the app's.

Money

Your rates against the room's quantities. Set once, used forever.

Set your rates FREE

BUSINESS, OR PRICE → YOUR RATES

What you charge per square foot, per foot, per each. Typed once, used on every job.

- 1 Bottom tab: **Business**. Scroll to **What you charge**. No room needs to be open — do this before your first scan.
- 2 Type a rate against each line. Tap out of the box.
- 3 Or, with a room open and the money in front of you: **Price → Your rates**. Same book, same numbers.

YOU WILL KNOW IT WORKED WHEN

Every room you measure prices itself — each line a rate you set times a quantity the room measured, and you can defend both.

Nothing here comes from anywhere else. No market data, no regional average, nothing guessing what drywall costs in your county. An item with no rate against it is named rather than priced at zero, because a quote that adds up perfectly and is short by a floor is the worst thing this could hand you.

Import a supplier's price list

SUBSCRIPTION

YOUR BUSINESS → YOUR SUPPLIER'S PRICES

Price against what you actually pay, not a guess.

- 1 Get the price file from the supplier — a CSV. Anything that opens in a spreadsheet can save as one.
- 2 Tap **Your business → Your supplier's prices**.
- 3 Tap **Choose a price list**. It shows you which column it thinks is which, against your own rows.
- 4 Confirm the mapping.

YOU WILL KNOW IT WORKED WHEN

Their prices are in your book, beside your own, filed under the store they came from.

It handles a file with no heading row, with metric units, or with the columns in any order — it shows you what it read before it uses any of it. Every line it cannot read is listed with the reason rather than guessed at: a board foot is a volume and a hundredweight is a mass, and neither becomes an area without a thickness or a density nobody told the app.

What the stores charge you

SUBSCRIPTION

BUSINESS → YOUR BUSINESS

What a named shop charged you, on a stated day, typed by somebody who saw it. That is a different number from what you charge, and it is kept in a different book.

- 1 Under **Your supplier's prices**, find **The stores you buy at** and type a shop into **Add a store** — “Floor & Decor”, “Miller Lumber”.
- 2 Under **Write down a price: Which store, What it is, What it costs**, per what, and **Seen on** which day.
- 3 Standing in the aisle: **Photograph the tag**, then type the number you can read on it. The photograph is the evidence, never the source — nothing is read off it by a machine.
- 4 Tap **Write it down**.
- 5 Everything you have written down is under **What the stores charge**, beside your own rate book: pick a store, search it, narrow it down.

YOU WILL KNOW IT WORKED WHEN

A price with a shop's name and a date on it — and, the second time you write the same item down, how far it has moved since, off two numbers you wrote yourself.

A cost is not a rate. Moving one into what you charge is a deliberate tap — **Use it as my rate**, or against a rate you pick — because copying a shelf price into your own book without a mark-up is how a season gets worked for nothing. There is no price feed

behind any of this and there is not going to be: no retailer here publishes a price API to build against, and a scraper breaks the week their markup changes. Nothing in this book was estimated, averaged or inferred, and if a shop has never quoted something the app says so rather than showing you another shop's number in its place.

Price a different number SUBSCRIPTION

PRICE → PRICE A DIFFERENT NUMBER

For a diagonal lay, a waste factor, or an order you round up.

- 1 Tap **Price a different number** on any line.
- 2 Type the quantity you want to price.
- 3 Type why — it will not take one without a reason.

YOU WILL KNOW IT WORKED WHEN

The quote prices your number, and *both* numbers stay on the line so the client sees the difference and the reason.

A quote with a typed number in it stops calling itself measured, even if every wall has had a tape on it.

Mark a job won or lost SUBSCRIPTION

PRICE → WHAT HAPPENED TO IT

How the app learns what your prices actually get accepted at.

- 1 Once a job is decided, tap **Won** or **Lost**.

YOU WILL KNOW IT WORKED WHEN

A record that, once there are enough of them, tells you what your own accepted prices look like.

Getting it agreed

The document a homeowner says yes to, and what freezes when they do.

Write a proposal SUBSCRIPTION

AGREEMENT → WRITE THE PROPOSAL

The work in sentences, a price, what is not included, and somewhere to sign.

- 1 Set your rates first — it will not write one with an unpriced line in it.
- 2 Go to **Agreement**.
- 3 Name the option and say in one line what it covers.
- 4 Tap **Write the proposal**.
- 5 Fill in who it is for, the address, and how long the price holds.
- 6 Answer **Where does this get signed?** lower down before you send it. The document that goes out is a different document depending on the answer, and the reminder above the send button says so.
- 7 The send button is at the foot of the proposal, under the last line of it, not at the top: **Send this proposal**, or **Send the signed proposal** once it is agreed.

YOU WILL KNOW IT WORKED WHEN

A document with your letterhead, the price from the takeoff, and your terms.

It refuses to carry a line you have no rate for. A proposal that quietly leaves work out is how a job is won at a loss.

The three-day right to cancel

SUBSCRIPTION

AGREEMENT → WHERE DOES THIS GET SIGNED?

A contractor who writes a proposal at a kitchen table and gets it signed there has made the kind of sale the FTC's Cooling-Off Rule covers — 16 CFR Part 429. The notice it requires is the seller's to fill in, not the buyer's.

- ❶ Put **Business address** on **Your business** first. That is where a cancellation gets posted, and the forms cannot be completed without it.
- ❷ On **Agreement**, answer **Where does this get signed? — Their home, Somewhere else, or Your premises**. Your premises means your own permanent shop, yard or office.
- ❸ Where the rule applies, set **The day it gets signed**. The deadline is counted from it and never typed.
- ❹ Read the lines underneath: whether it applies and why, what the deadline works out to, and what you have to hand over.
- ❺ Send it. The notice and two completed cancellation forms are on the document — one for them to send back, one to keep.

YOU WILL KNOW IT WORKED WHEN

A proposal carrying the notice, both forms, your name and address on them, and a deadline the app worked out rather than asked you for.

Being invited to quote does not take a sale out of the rule — “following an invitation by the buyer” is inside the definition, not outside it. Business days are the rule's, not yours: Saturday counts, Sunday and federal holidays do not. This is the federal rule only. Several states give a buyer longer and some require wording of their own; ScanToBid does not know which state your job is in, and says so on the notice rather than letting you assume three days is the answer. It is not legal advice. Until you answer the question the proposal goes out with no notice on it, and with no business address it prints a block saying the notice could not be completed rather than a form with a blank where the address goes.

Get it signed SUBSCRIPTION

AGREEMENT → SIGN IT

Signed in the kitchen, with the record that makes it stand up.

- 1 Tap **Take this one** on the option they chose.
- 2 Hand them the phone.
- 3 They type their name, tick that they agree to sign electronically, and sign with a finger.
- 4 Tap the black button, which names the option and its price — **Agree to Option A — \$18,400.**

YOU WILL KNOW IT WORKED WHEN

The signature, and the evidence written out in plain words — who signed, when, on what, the exact sentence they agreed to, and a fingerprint of the document.

This records that somebody signed. It does not verify who they are, and the app never claims it does. It is one of two ways a job gets agreed; the other is a signed copy that came back, and the card below says what that costs you in evidence.

When they sign the paper and send it back SUBSCRIPTION

AGREEMENT → A SIGNED COPY CAME BACK

Most remodelling jobs are not signed on a phone. They print it, sign it at the kitchen table on Sunday night, photograph it and text it back. That can agree the job — with the weakness written on the agreement.

- 1 Send the proposal first. This section only appears once one has actually left this phone, because the fingerprint taken as it went is the only thing a returned sheet can be checked against.
- 2 Choose the file under **The photograph or PDF they sent.**
- 3 Fill in **Who signed it** and **The day they say they signed it.**
- 4 Under **How it got back to you** pick **A photograph, A PDF or On paper**, and add anything worth putting on the record.
- 5 Tap **File the signed copy.** It is kept on this job, against this proposal, with both fingerprints.
- 6 To bill against it, tap **Agree the job on this signed copy** — the button names the option and its price.

YOU WILL KNOW IT WORKED WHEN

The job is agreed, the Work screen will write an invoice against it, and the agreement carries a paragraph saying how it was agreed.

That paragraph does not stay on one screen. It prints under the money on

every invoice, in every list of invoices, on the line that goes into the QuickBooks export a bookkeeper opens, and the proposal's heading over the block reads **Agreed on a signed copy that came back** rather than **Signed**. It says what is true: nobody watched them sign, this app has not checked anybody's identity, and the day they signed is their word for it. What it does bind is that the version sent and the copy returned are both fingerprinted, so neither can be swapped for another — and if the proposal has been edited since it went out, this refuses rather than agreeing a job against a document nobody signed.

Change orders SUBSCRIPTION

AGREEMENT → WHAT HAS CHANGED SINCE

The reason scope creep stops being an argument.

- 1 Once it is signed, that scope freezes.
- 2 Change anything — move a wall, add work, change a rate.
- 3 Go back to **Agreement**.

YOU WILL KNOW IT WORKED WHEN

Every difference comes back as a priced line, biggest first, with the signed total beside the new one.

If the agreed document is edited instead of a change being raised against it, the app catches it and says so. The signed version is the one that counts.

The work

When it happens, and asking to be paid for it.

Put days in your calendar

SUBSCRIPTION

WORK → ADD TO MY CALENDAR

Your own iPhone calendar. No service, no monthly fee, already on every device you own.

- 1 Go to **Work**.
- 2 Pick what kind of day it is — measure, present, work, or other.
- 3 Say what it is, pick the day, and set the times.
- 4 Tap **Put it in the calendar** to add it to the list.
- 5 Tap **Add to my calendar** to send them to the phone.

YOU WILL KNOW IT WORKED WHEN

A calendar named after your business, which you can switch off on a Sunday without switching off your life.

The first time, iOS asks permission. ScanToBid asks only to *add* events — it never reads what else is in your calendar.

Send the dates to somebody

SUBSCRIPTION

WORK → SEND IT TO SOMEBODY

A file every calendar reads — Apple, Google, Outlook.

- 1 Add the days first.
- 2 Tap **Send it to somebody**.
- 3 Choose how to send it.

YOU WILL KNOW IT WORKED WHEN

They tap it and it lands in whatever calendar they use.

Write a change order SUBSCRIPTION

WORK → WRITE THE CHANGE ORDER

The job grew. Put it in writing, priced, before the work happens.

- 1 The job has to be signed first — a change order amends something somebody signed.
- 2 When anything has moved since signing, the Work screen says how much and that none of it is on a bill.
- 3 Type your own change order number.
- 4 Say **Why this is happening** in a sentence. It is one line now and the whole argument later.
- 5 Say how many days it adds to the finish date. Nought is an answer.
- 6 Tap **Write the change order**.

YOU WILL KNOW IT WORKED WHEN

A change order waiting to be signed, with the price, the days and the reason on it.

Nothing on a change order is billable until it is signed. That is on purpose: a bill for work nobody agreed to is the one accusation you cannot answer.

ScanToBid in a browser FREE

APP.SCANTOBID.APP

Everything but the scan runs on any computer, at app.scantobid.app.

- 1 Drawing a room by hand, correcting one, the 3D view and the dimensions are free there, with no account and no card.
- 2 The takeoff, prices, proposals, signatures, change orders, insurance mode and the exports are the subscription — the same line the phone draws.
- 3 A `room.json` from a scan opens there, and so does a ScanToBid job file somebody sent you.
- 4 There is no login, there and here. Nothing to sign into and nothing to forget.

YOU WILL KNOW IT WORKED WHEN

The same screens, on a computer, with the same line drawn through them.

A browser is not a safe place to keep work. Safari deletes what a site has stored after seven days you have not been back, and any browser may clear it sooner when the machine is short of space. Write the job to a file.

Open your browser with the code from this phone SUBSCRIPTION

BUSINESS → SCANTOBID IN A BROWSER

You already pay. You should not meet a paywall in your own browser.

- 1 On this phone, go to **Your business** and scroll to the bottom.
- 2 There is a code that starts TL-. Tap **Copy the browser code**.
- 3 On the computer, open app.scantobid.app and paste it into the box on the front page.
- 4 Once. From then on that browser does what this phone does.

YOU WILL KNOW IT WORKED WHEN

Every paid screen open in that browser, with no account anywhere.

It is a courtesy lock, not security. A code you forward works in whoever's browser you forward it to. It is there so you are not asked to pay twice, not to stop anybody.

A change order carries your mark-up SUBSCRIPTION

WORK → WRITE THE CHANGE ORDER

The change is priced the way the job was: the work, then your mark-up on it, on its own line.

- 1 Your mark-up is the one in the **Mark-up on the whole job** box on your rates. There is nothing extra to set.
- 2 The change order lists the work that moved, then a **Mark-up** line under it.
- 3 The figure the screen calls the change is the two together — the same figure a fresh quote of the whole job would give you.
- 4 The invoice carries that mark-up line too, so the column your client adds up comes to what you asked for.

YOU WILL KNOW IT WORKED WHEN

What you agreed, plus the change, equals what the job would be priced at today.

Change the mark-up rate on its own and no line of work moves — but the money does, and that is a change order like any other. The Work screen says so rather than calling the job settled.

Something that already changed, changing again SUBSCRIPTION

WORK → CHANGES TO WHAT WAS SIGNED

A rate you already raised once can be raised again, and it is a second change order.

- 1 Everything is measured against what was **last** agreed — the baseline plus every change order somebody has signed.
- 2 So a floor signed for at 520 sq ft, then measured at 600, is a change of 80 sq ft. Not 180.
- 3 The line says so in those words:
Floor has moved again since it was signed for.
- 4 Raise it, get it signed, and it goes on the bill beside the first one.

YOU WILL KNOW IT WORKED WHEN

Two change orders on the same work, each for its own share, and neither one billed twice.

A line sitting exactly where the last signed change order left it is not named again. Nothing has happened to it, and there is nothing to raise.

Get the change order signed

SUBSCRIPTION

WORK → AGREE TO THIS CHANGE

Two ways, and they count the same.

- 1 They are with you: type their name, tick the electronic-signature line, sign with a finger, and tap **Agree to this change**.
- 2 They are not: tap **Send it to be signed**. That file carries the price, the days, the reason and somewhere to sign by hand.
- 3 Either way it lands in the list marked **On the bill**.

YOU WILL KNOW IT WORKED WHEN

The agreed figure on the Work screen goes up by exactly what the app said was not on the bill.

A change order that is edited after it is signed stops matching its signature, and the next invoice refuses it and says so.

Write an invoice SUBSCRIPTION

WORK → WRITE THE INVOICE

Built from what was signed, never from what the room measures today.

- 1 The job has to be signed first.
- 2 Pick **Deposit**, **Progress payment** or **Final payment**.
- 3 Type your own invoice number.
- 4 For a deposit, say what per cent of the job it is.
- 5 For a progress payment, say how much of the job is done. It asks for that share and no more.
- 6 Say when it is due and how to pay you.

YOU WILL KNOW IT WORKED WHEN

An invoice that says what is left on the job, and settles it exactly when it is the last one.

The same work cannot be invoiced twice. Ask for more than is left and it refuses and says why. Only the signed scope and signed change orders go on it — anything else that has moved is named underneath and left off.

Write down money that came in

SUBSCRIPTION

WORK → MONEY CAME IN

Who has paid, who has not, and how late they are.

- 1 Write an invoice first.
- 2 Tap **Money came in** under it.
- 3 Say how much, when, and how it came — **Cash**, **Cheque**, **Bank transfer**, **Card** or **Something else**.
- 4 Put a reference if you have one: a cheque number, a wire reference, or the last four digits.
- 5 Tap **Write it down**.

YOU WILL KNOW IT WORKED WHEN

The top of the invoice list says what is still out, worst first, with how many days past due.

ScanToBid takes no payments and holds no card details — you are writing down what arrived, the way a paper ledger does. Type a full card number in the reference and it refuses to store it. That refusal is the reason the app needs no security certification and cannot leak anybody's card.

Send it to QuickBooks SUBSCRIPTION

WORK → SEND TO QUICKBOOKS

A file, not an integration — nothing about it stops working on a Tuesday.

- 1 Write at least one invoice.
- 2 Tap **Send to QuickBooks**.
- 3 Import the file in QuickBooks, or open it in a spreadsheet first.

YOU WILL KNOW IT WORKED WHEN

Your invoices in your books, on Online or Desktop.

Insurance work

A whole second mode, for restoration and claims.

Turn insurance mode on SUBSCRIPTION

INSURANCE → TURN IT ON

Off by default, because a remodeler does not want a claim number on every kitchen.

- 1 Go to **Insurance**.
- 2 Tap **Turn it on**.
- 3 Fill in the claim number, the date of loss, what caused it, whose property it is, the address and the adjuster.

YOU WILL KNOW IT WORKED WHEN

A claim, with what is still missing named — and nothing blocked by it.

Mark it while you are still in the room SUBSCRIPTION

SCAN A ROOM → MARK

Point the phone at the stain and tap it. It lands on the plan, on the right wall, with the photograph attached — before you have left.

- 1 Start a scan and walk the room as usual.
- 2 When you see something wrong, tap **Mark** at the bottom. A red bar says *Point at the damage and tap it*.
- 3 Point at the thing and tap the picture. The phone takes a photograph at that instant and holds the spot.
- 4 Say what it is — pick water, mould, fire, smoke, impact, wind or other, and type a line. **Mark it**.
- 5 Marking switches itself off. Tap **Mark** again for the next one.

YOU WILL KNOW IT WORKED WHEN

The button counts up — “1 marked”, “2 marked” — and every one is on the plan when the scan opens.

It refuses a tap on a surface the phone has not mapped yet, and it says so on the spot rather than putting a pin where you were not standing. Scan across the spot and mark it again.

What a pin does and does not do

SUBSCRIPTION

PLAN, AFTER A SCAN

A pin is you saying “look at this”. It is a place and a photograph, never a quantity.

- 1 It is drawn where you were pointing, on the wall it was nearest to.
- 2 A pin more than a foot from every wall belongs to no wall — a boiler in the middle of a basement is not on a wall, and saying it was would be wrong on a claim.
- 3 It produces no square feet. The area still comes from a tape, or from a damaged area you draw deliberately.

YOU WILL KNOW IT WORKED WHEN

The claim carries the photograph and the words you said, on the wall you said them about.

If a pin could not be placed, the room says so under **What this capture looks like** and quotes the reason for every one. Nothing is ever moved somewhere plausible to avoid the message.

Mark the damage SUBSCRIPTION

PLAN → TAP A WALL → + DAMAGED AREA

Marked while you are standing in front of it.

- 1 Tap the wall the damage is on.
- 2 Tap **+ damaged area** and pick what caused it.
- 3 Say how far from the corner it starts, how wide it is and how high it goes.
- 4 Tap **Mark it**.

YOU WILL KNOW IT WORKED WHEN

A red stretch on the drawing, and the square feet of board and feet of base that actually is — with the openings in it deducted.

Cut heights, moisture and photographs SUBSCRIPTION

THE DAMAGE YOU MARKED

What an adjuster asks for, recorded as you go.

- 1 Say how high you cut the board back to.
- 2 Log a moisture reading each time you take one, with the meter scale.
- 3 Attach a photograph of it.

YOU WILL KNOW IT WORKED WHEN

A drying curve, and a photograph attached to the wall it is of.

What the damage comes to

SUBSCRIPTION

INSURANCE → WHAT THE DAMAGE TAKES

The marks you made, priced at your own restoration rates. It is a different sheet from the room's takeoff because it goes to a different payer.

- 1 Mark the damage first. Nothing on this sheet comes off a surface nobody marked.
- 2 On **Insurance**, read down **What the damage takes**. It is in stages — tear out, protect, rebuild.
- 3 Tap **Your rates** beside it. That opens **What you charge on restoration**; type a rate against each line.
- 4 Come back and it totals. An item you have set no rate for is named and left out of the total rather than priced at nothing.
- 5 **Copy the scope** takes the sheet as text. **Spreadsheet** takes it as CSV.

YOU WILL KNOW IT WORKED WHEN

A figure for putting the marked damage right, every line of it traceable to a mark you made and a rate you typed.

These rates are kept apart from your remodel rates deliberately. Tear-out and rebuild on a claim are not priced the way a kitchen is, and one book holding both is how a carrier gets billed a remodel rate. A pin is a marker and carries no work, so it is named on

the sheet rather than quietly producing nothing.

Send it to the adjuster SUBSCRIPTION

INSURANCE → SEND IT TO THE ADJUSTER

One document with the measurements, the areas, the photographs — and, now, the money.

- 1 Go to **Insurance**.
- 2 Tick which rooms this claim covers, if there is more than one.
- 3 Tap **Make the claim document** for the file anything opens, **As a PDF instead** for a PDF, or **Everything, in one archive** for the drawing, the data and the photographs together.

YOU WILL KNOW IT WORKED WHEN

A document you would be happy to be questioned about — and one that carries a total, per mark and for the sheet, at your own rates.

The money on it is the restoration scope and nothing else: what it takes to put the marked damage right. The room's remodel takeoff is a separate sheet for a separate payer and none of it is on there. Set no restoration rates and the document carries no money at all, exactly as it always did, rather than announcing a total of nothing. The archive is **not an .esx** and Xactimate will not open it — the app says so on the screen rather than letting somebody find out at the other end.

Sending things out

Everything that leaves the phone, and what each one is for.

The drawing SUBSCRIPTION

FILES → SEND THE DRAWING

The plan as a picture, with your letterhead and the caveat on it.

- 1 Go to **Files**.
- 2 Tap **Send the drawing**, or print it.

YOU WILL KNOW IT WORKED WHEN

A sheet a client can read, that says plainly whether it has been measured.

The client file SUBSCRIPTION

FILES → SEND THE DRAWING → CLIENT FILE

One file that opens in any browser, with nothing fetched from anywhere.

- 1 Tap the client file option.
- 2 Send it however you send things.

YOU WILL KNOW IT WORKED WHEN

They open it and it works — offline, forever, with the drawing inside it.

CAD, for whoever asks SUBSCRIPTION

FILES → CAD

A DXF, for an architect or a cabinet shop.

- 1 Tap the CAD option.
- 2 Send the file.

YOU WILL KNOW IT WORKED WHEN

A drawing they can open in their own software.

What has left this phone SUBSCRIPTION

UNDER ANY BUTTON THAT SENDS SOMETHING

The app writes down that a document went out: what it was called, what the screen called it, how big it was, when it went, and a fingerprint of the exact bytes that left.

- 1 Send a proposal, a change order or a claim.
- 2 A line appears under that button saying how many times this document has left this phone and the last day it did.
- 3 Where the screen has the current version to hand, the line goes on to say whether the copy that went is this document — or that something has changed since, so what they are holding and what is on this phone are two different versions.

YOU WILL KNOW IT WORKED WHEN

You can answer “did I send that?” from the app, standing in a driveway, with the person asking on the line.

It never says “sent” and it never will. The app hands a file to the phone’s own share sheet and is blind after that: no recipient, no delivery receipt, no read receipt, and the sheet answers exactly the same way whether somebody sent a message or opened one and changed their mind. So it says **Handed over** — a claim about this phone rather than about somebody else’s. Backing out of the share sheet records nothing at all, which is the one honest negative the phone gives back. And the record lives on this device:

silence means the record is silent, not that nothing was sent.

The field sheet SUBSCRIPTION

FILES

A list to carry and write on — what to measure, ranked.

- 1 Tap the field sheet.
- 2 Print it or open it on the phone.

YOU WILL KNOW IT WORKED WHEN

A page you can take back to the room with a pencil.

The subscription

What it costs and how to manage it.

Starting it

ANY LOCKED SCREEN

One plan, monthly or yearly — and nothing to buy at all until ScanToBid is on the App Store.

- 1 Tap anything locked. It says what that feature does before it says it is paid.
- 2 Until launch the screen reads **Everything is on, free, right now**, and it means it: there is nothing to buy and nothing is being withheld.
- 3 After that, pick monthly or yearly. The price, and any free trial attached to it, are whatever the App Store is offering that day — the screen reads them from Apple rather than from a number typed into the app.
- 4 A free run of 14 days can be taken on the phone instead, once per phone; when it has been used the screen says so. **Redeem a code** takes an App Store offer code.
- 5 **Not now** closes the screen and changes nothing.

YOU WILL KNOW IT WORKED WHEN

Everything opens.

If no plans appear, the screen says which of the two it is — no signal, or the subscription still waiting to be approved — under **The plans are not showing**, rather than spinning at you forever.

The founding rate

PAYWALL → FOUNDING RATE — THE FIRST 100

The first hundred subscribers keep the price they started on, for good.

- 1 The screen shows the price the App Store is charging today — it is never a figure typed into the app.
- 2 Monthly and yearly both have a founding price, so paying by the year is not punished for it.
- 3 Apple keeps a subscriber on the price they signed up at when it goes up for new people, so it holds without anybody administering it.

YOU WILL KNOW IT WORKED WHEN

The block on the paywall names the rate. When it is gone, the block is gone with it.

It disappears when the founding products are renamed in App Store Connect. The app cannot count subscribers — it never phones anywhere — so that rename is what ends the offer, and it has to actually be done.

If you already paid

PAYWALL → ALREADY PAID? PUT IT BACK

For a new phone, or a reinstall.

- 1 Tap **Already paid? Put it back**.
- 2 It checks with Apple on the Apple ID you are signed in with.

YOU WILL KNOW IT WORKED WHEN

Everything opens again, with nothing charged twice.

If you paid with a different Apple ID, sign in with that one in Settings first.

Stopping it

IPHONE SETTINGS

In the App Store, not by asking anybody.

- 1 iPhone Settings → your name → Subscriptions → ScanToBid → Cancel.

YOU WILL KNOW IT WORKED WHEN

It stops renewing. Every room you have measured stays on the phone.

Sending the reports

BUSINESS → WHEN SOMETHING GOES WRONG

If the app quits on its own, or a screen goes blank, there is a report on the phone.

- 1 Bottom tab: **Business**. Scroll to the bottom.
- 2 Under **When something goes wrong**, each report says what it was and when.
- 3 Tap **Send them**. It opens a mail to support@scantobid.app with everything attached.
- 4 **Delete them** throws them away, and asks twice because it cannot be undone.

YOU WILL KNOW IT WORKED WHEN

A mail is open with one file attached, waiting for you to press send.

A crash from today usually appears tomorrow. iOS hands crash reports over on a later launch rather than at the moment of the crash. Anything a screen inside the app throws is written straight away.

When it misbehaves

The app writes down what went wrong. Nothing is sent unless you send it.

What is in one, and what is not

BUSINESS → WHEN SOMETHING GOES WRONG

Which build, which model of phone, and what failed. Nothing about the job.

- ❶ No room, no client, no address, no photograph and no measurement is in a report.
- ❷ Nothing goes anywhere on its own — there is no server in this app and no network call that sends one.
- ❸ The files are in the Files app under ScanToBid → Reports if you would rather look yourself.

YOU WILL KNOW IT WORKED WHEN

You can read the whole file before you send it.

Written against the app as it stands on 28 August 2026. Every screen name and every button label in it was taken from the app's own source rather than from memory, and docs/build/check-guide.py refuses to let one through that the app does not have. Where something is not built yet, this says so rather than describing it.
